This roller enables the dishrack to move in and out of the dishwasher. Because these rollers generally wear out at the same time, we recommend replacing them in pairs. If the door is leaking then the door seal may be defective. If the dishwasher wont fill properly, then the water valve is likely restricted and will need replacement. If the dishwasher is underfilling, it wont clean dishes effectively. Corroded or rusted dishracks should be replaced to avoid parts of the rack falling down and getting into the circulation pump damaging the pump. If the dishwasher does not wash properly then the wash impeller could be worn or the motor could be defective. If detergent dispenser does not open or dispense the detergent or rinse aid properly then dispenser will need to be replaced. Since 1912, weve learned to recognize the most common problems. Once there, you will be givenThe site maintains the referenceUse of this Web site constitutes acceptance of the Terms of Service and Privacy Policy. Im assuming from the model number you are in the US and therefore on a 120v supply. The heater is about 2000 watts, so a 10 amp draw is indicative of increased resistance and therefore a fault on a 120v system. Either burning out or possibly shorting to earth. This is consistent with the symptoms of the fault, i.e. long cycle times but with evidence of heating. If there is a short to earth within the heater, it will still heat and draw current. A short to earth within the heater wont necessarily trip a breaker, but it will trip an RCD if you have one fitted. If you have continuity between hot and earth, the water heater has failed and needs to be replaced. Im assuming you have a multimeter for conducting these tests. Please can you resistance test the water heater as described above and let me know the results. I also need to know whether you are on a 120v or 220240v supply. Please disconnect the dishwasher from the power supply before conducting electrical testing. Regards, BElectric. Login to post You can resolder the joint, replace the relay or replace the control. Control board part number is 00266746. The dishes on the bottom rack are cleaning just fine. I have taken the rotating spray arm off and cleaned it. I have an older dishwasher also and recently mywife also complained about it not cleaning right. Bought new spray arms online and installedthem in minutes.now the thing works like new. However I have also foundthat if the heating element goes bad then that also can mess things up bad. So I would buy new spray arms, and also check out the heating element to makesure it is working. Here is a tip that

will help you with the online buying. Dishwasher Problems The Heating Element not Working Dishwasher Maintenance There is a common circuit board issue where a cold solder joint on the heater relay pops. <http://www.fabulous-vintage.ro/files/compaq-presario-sr1920nx-manual.xml>

The water does not heat sufficient to evaporate any longer. Consult your manual for self diagnosing trouble shooting codes or go to appliance aid.com. If the board connection is the issue I have repaired several, however Bosch recommends replacement only and sometimes supplies the parts free. By now I think you have found the two screws on the sides of the inter part of the door. Did replacing the module fix your problem. I have the same problem. Mike I removed the entire door was tightening front handle and removed too many screws and now am struggling getting it back on the hinges. Any suggestions welcome. Thanks. If your dishwasher model was released annually to the same hype as most mobile phones are every year, the release date would be ingrained in your memory even if you're not a fan of that particular model and never planned to get one. It is also handy to know the year for insurance purposes. This information will come in handy if you need to buy any spare parts or, again, if your dishwasher develops a fault and needs to be serviced. Inside the door or on the side panel of your dishwasher, you will find strings of numbers and letters hopefully still legible after years of use. One of these numbers is beginning with the letters FD. This is the serial number you're looking for. Ignore all these number but the first four. The last two digits represent the month. The production month is February. In that case, ignore the first digit, giving you the year 02 2002 and the month 05 May. She writes about education, parenting and linguistic technology.
